

OTP Related APis are written in uae-vat-node.

Route : <https://dev.aiqod.com:843/adhigam-api/website/send-verify/otp>

We use the same api for 3 purposes: send, retry and verify otp things. Just change the action key in the body while calling the api based on the requirement.

Body :

```
{
  "mobileNo": "7776808085",
  "action": "sendOtp"
}
```

Code is present in src/api/wesite/index.js.

We have to configure the two keys in resource/config.json to work the otp calls.

```
const authkey = config.msg91AuthKey;
const template_id = config.msg91templateId;
```

Using these creds only, msg91 send the OTP to the no.
